Abstract of JP1067618

PURPOSE: To reduce the scale of a character input device and also to shorten the searching time of desired input characters, by outputting a special form character in response to the input data supplied by means of a special condition input key and a character input key in case a correctness deciding means decides that said input data is correct.

CONSTITUTION: A correctness deciding means 20 decides whether the input data supplied by means of a special condition input key 12 and a character input key 11 is correct or not. When the correctness of the input data is confirmed, a special form character is outputted in response to said input data. Thus the input is possible for various special form characters and at the same time the number of numeric characters can be decreased on a keyboard. As a result, the scale of a character input device is reduced and the searching time is shortened for desired input characters.
